#### DEEP FAKES

# The synthetic data generation process

#### **Common Clarifications**

- The source datasets can be as small as 100 or 150 patients. We have developed generative modeling techniques that will work for small datasets.
- The source datasets can be very large then it becomes a function of compute capacity that is available.
- It is not necessary to know how the synthetic data will be analyzed to build the generative models. The generative models capture many of the patterns in the source data.

## Assessing the Utility of Synthetic Data

- Expert Discrimination
  - Can a clinician to tell the difference between a real and a synthetic

record?

- Fidelity
  - How similar the joint distribution of the synthetic data is to the joint distribution of the real data?

### Replicability

 Are the analysis findings from models trained on the synthetic data the same as the findings on the real data, and are the population inferences on the synthetic data valid ?
